

40. メルボルンのデジタル緑化活動(1): 構造理解

Most people would agree that parks with a lot of nature and green areas are important for cities of all sizes. Some of the benefits of having green spaces in urban areas are that they have the ability to absorb carbon dioxide, soak up excess rainfall, and reduce city temperatures. A promising project that many large cities around the world have taken part in is called the Million Tree Initiative. Cities such as London, New York, and Ottawa have made pledges to plant a large number of trees in their cities. This government-based program has increased the amount of nature in those cities, but maintaining it has proven to be a more difficult task than anticipated. Keeping the trees healthy in new green areas is a long-term task that requires the financial support of the local government and the involvement of residents.
