

71. 人間と AI の未来予想図(3)：構造理解

Consequently, creating new jobs and retraining people to fill them will not be a one-off effort.

The AI revolution won't be a single watershed event after which the job market will just settle into a new equilibrium. Rather, it will be a series of ever-bigger disruptions.

Already today few employees expect to work in the same job for their entire life.

By 2050, not just the idea of 'a job for life', but even the idea of 'a profession for life' might seem old.

Even if we could constantly invent new jobs and retrain the workforce, we may wonder whether the average human will have the emotional stamina necessary for a life of such endless upheavals. Change is always stressful, and the exciting world of the early twenty-first century has produced a global epidemic of stress.

As the rapid changing of the job market and of individual careers increases, would people be able to cope? We would probably need far more effective stress-reduction techniques — ranging from drugs through neuro-feedback to meditation — to prevent our minds from snapping.

By 2050 a 'useless' class of people might emerge not merely because of an absolute lack of jobs or lack of relevant education, but also because of insufficient mental stamina.
